

A Check List of Vascular Plants,
Fir Canyon, Clark Mountain Range,
Mojave Desert

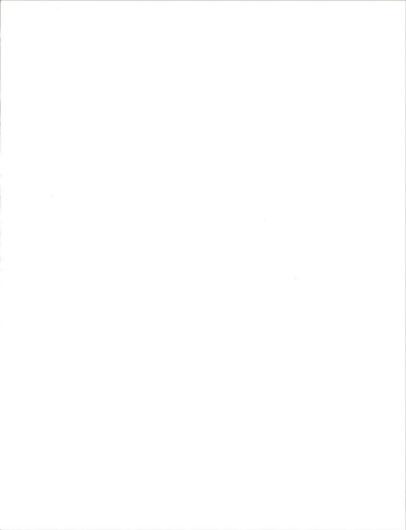

by

Barry A. Prigge

2 April 1979

Presented to the Bureau of Land Management in partial fulfillment of contract no. CA-060-CT7-2430, Floristic Inventory of the eastern Mojave Subdivision

> Bureau of Land Management Library Bldg. 50, Denver Federal Center Denver, CO 80225

The region included in this check list is highlighted in yellow on the following map and intersects three plant communities. These are the blackbush scrub community which occurs below c 5100 ft, the pinyon-juniper woodland, above c 5100 ft, and the pinyon-white fir forest, between c 6300 and 7700 ft. Substrates for these communities are predominantly limestone, but some scattered outcrops of shale occur on steeper slopes of the pinyon-juniper woodland.

Data presented are based on field collections and observations from all growing seasons since 1972. Specimens are deposited primarily at California State University, Los Angeles and Rancho Santa Ana Botanic Garden. Some recent collections will be deposited with the California Desert Plan Program of the Bureau of Land Management in Riverside.

Frequency data were determined by qualitative observations and are based on the following scale.

1 = Rare

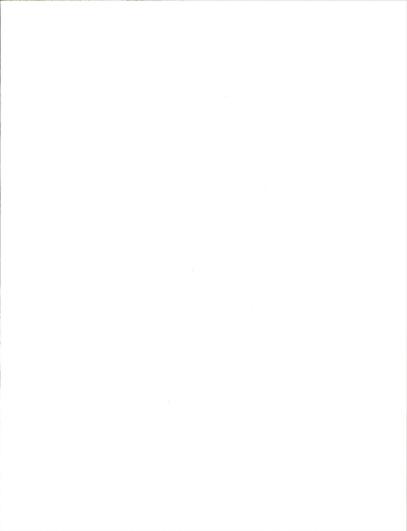

2 = Infrequent

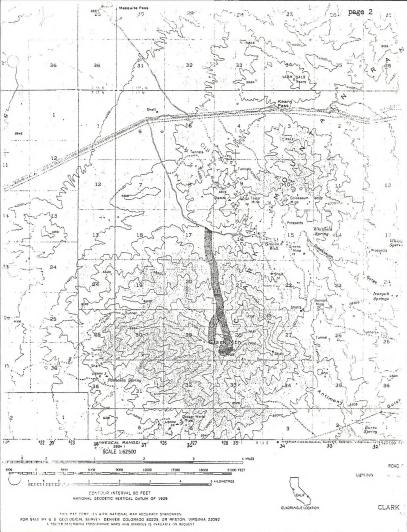

3 = Frequent

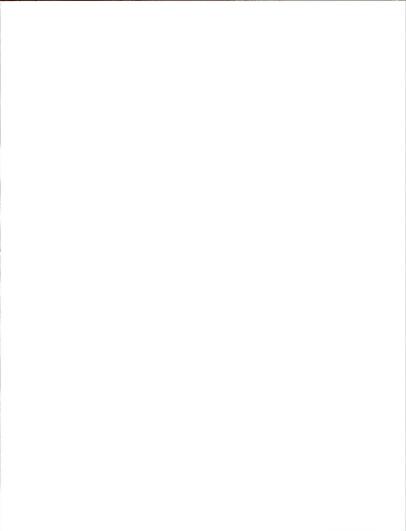

4 = Common

5 = Very Common

Where elevation data were uncertain, neither elevation or frequency data were listed.

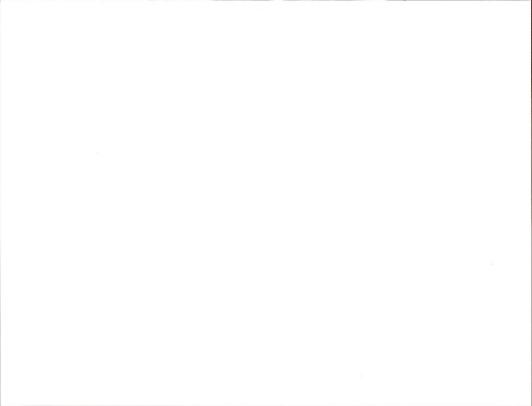

CHECK LIST OF VASCULAR PLANTS,
